Lab 8: Keyboard (Calculator)

Objective

Implement the keyboard function

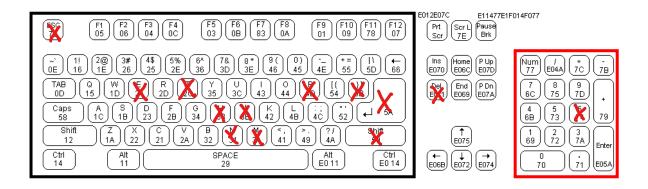

Prerequisite

- Fundamentals of logic gates.
- Logic modeling in Verilog HDL.
- Keyboard control procedure

Experiments

放算 款字 keep on the 55D
Implement key board using the left-hand-side keyboard (inside the black blocks).

- 1.
 - Press 0/1/2/3/4/5/6/7/8/9 and show them in the seven-segment display. When a new number is pressed, the previous number is refreshed and overwritten.
 - Press a/s/m (addition/subtraction/multiplication) and show them in the 1.2 seven-segment display as your own defined A/S/M pattern. When you press "Enter", refresh (turn off) the seven-segment display. 为其作不最示
- 2. Implement a single digit decimal adder using the keyboard as the input and display the results on the 7-segment display (The first two digits are the addend/augend, and the last two digits are the sum). 按下第二個,結果要馬上出來
- 3. Implement a two-digit decimal adder/subtractor/multiplier using the right-hand-side keyboard (inside the red block). You don't need to show all inputs and outputs at the same time in the 7-segment display. You just need to show inputs when they are pressed and show the results after "Enter" is pressed.

EE223002 Logic Design Lab

- 4. Implement the "Caps" control in the keyboard. When you press A-Z and a-z in the keyboard, the ASCII code of the pressed key (letter) is shown on 7-bit LEDs.
 - 4.1 Press "Caps Lock" key to change the status of capital/lower case on the keyboard. Use a led to indicate the status of capital/lowercase in the keyboard and show the ASSCII code of the pressed key on 7-bit LEDs.
 - 4.2 Implement the combinational keys. When you press "Shift" and the letter keys at the same time, 7-bit LEDs will show the ASCII code of the uppercase/lowercase of the pressed letter when the "Caps Lock" is at the lowercase/uppercase status.
